

FixProve — AID Funding Roadmap Canvas

Business Incubator: Funding Pathway (Aalborg Institute for Development) · Module 1, August 2026 · Prepared by Yehor Kaliberda

1 · Business Today

What do you do?

FixProve checks AI-written code before it ships. AI tools sometimes invent things that don't exist — a function, an import, a method call that looks right but isn't. FixProve catches those automatically by checking every reference against what is actually installed in the project. It doesn't guess and it doesn't use AI itself — a hard, deterministic check, like a spell-checker for code that only flags what it is certain is wrong.

Who are your customers?

Small software teams (roughly 10–50 people) writing Python, TypeScript or JavaScript and using AI tools heavily to write code. The buyer is whoever owns the team's build pipeline — the person accountable if broken AI code reaches production.

What stage are you at?

Live, free, and public. The command-line tool works and anyone can install it today (published on npm and PyPI). A second version that plugs directly into a team's code-review process exists but is not yet open to outside users. No paying customers — currently running a focused push to find out whether people will actually use and pay for it, rather than guessing.

2–3 strongest achievements

- Shipped a working product solo and kept it running cleanly for months — real code, real releases, real legal pages, no shortcuts.
- Built a disciplined process: every claim verified before it is trusted; nothing published on hope.
- Handled the unglamorous side properly — company registration, on-time tax filings, independent legal review underway.

Biggest strength

Follow-through under uncertainty: verifying properly and finishing what I start, even when the honest answer at a given moment is “we don't know yet.”

2 · Challenge / Opportunity

Starting point: Opportunity. Nothing external is blocking the business. AI-generated code is now the norm on many teams, and the specific mistake FixProve catches — code referencing things that don't exist — is a growing problem, not a shrinking one. A working, live product already solves it reliably.

“The opportunity I want to capture is...” proving there is real, paying demand for a tool that catches AI-invented code before it ships. The product is built, live and free today; the opportunity is converting that into installs, users, and a first paying tier.

Why is this important now?

- The window to become an early, trusted answer to this problem is open now, not indefinitely.
- The product has been ready for months — every week without a real market test is unclaimed opportunity, not extra safety.
- A near-term personal decision (study vs. full-time founding) makes finding out now worth more than finding out later.

3 · Goal (12 months)

“In 12 months, I want my business to have its first paying customers” — a small number of real teams who installed FixProve, use it in daily work, and pay for it. Everything else (more features, more languages, more markets) waits until that single proof exists. Deliberately modest, measurable, and achievable: not “grow 10×,” but “prove the first krone.”

4 · Activities & Investments

1. Open the team version to outside users	The code-review-integrated version is built but closed. Without opening it, teams cannot fully adopt. Essential.
2. Complete the legal review	Professional check of privacy/terms — required before charging. Already in motion (first lawyer meeting secured). Essential.
3. Market directly to hand-picked teams	Personal outreach to 20–30 small AI-heavy teams; no ads, no mass mail. Four already contacted. Essential.
4. Learn from first users	Talk to every installing team; learn what they would pay for. Evidence-based pricing. Important.
5. Build the payment tier	Activate the prepared payment setup once legal review is done and demand is proven. Essential, sequenced last.
6. Speak where customers are	Community talks (one already agreed with a local developer meetup). Low cost, builds trust. Lower priority.
7. Certify compliance basics	Confirm how new EU software rules (Cyber Resilience Act) apply, within the legal track. Lower priority.

5 · Expected Results & Impact

Open the team version

Teams use it in their real workflow → real usage data, first trust, and the demand question answered with facts.

Legal review

The business can legally charge; customer trust rises; compliance risk drops.

Direct outreach

First users → first feedback → first revenue path. Zero cash cost — only time.

Learn from users

Pricing built on evidence, not guessing; the product improves where it matters.

Payment tier

Interest becomes income: first krone, first customer, a fundable business.

Broader impact: fewer AI-written errors reaching production for every adopting team — saved developer hours, higher software quality, and a small Danish business earning from a global problem.

6 · Priorities & Timeline

0–3 months	Open the team version · direct outreach · legal review (already started) · first user conversations
3–6 months	Learn and improve from real users · activate payment tier if demand is proven · community talk
6–12 months	Convert users to first paying customers · compliance check · repeat what works

Minimum viable project: the three MUSTs alone — open the door, be legally allowed to charge, and personally tell 20–30 right teams it exists. Cost: almost only founder time plus a small legal fee. Even if nothing else happens, this answers the one question everything depends on: will anyone pay?

7 · Risks & Alternatives

Nobody pays, even after a real push	No business — core question answered “no.”	Product stays free as a portfolio asset proving execution; effort redirects to a new, demand-first-validated venture. Even failure produces a clear, useful result.
Free version is enough — nobody needs the paid tier	Usage without revenue.	Learn from users what they would pay for; reshape the paid offering on evidence.
A big player builds the same check natively	Standalone market shrinks.	Stay the independent, verifiable option for the niche they serve poorly; worst case the tool remains a credibility asset.

Legal/compliance costs exceed pre-revenue capacity	Delay to charging.	Already mitigated: deferred-payment terms negotiated, minimal first review scoped, spend follows proof of demand.
Solo-founder capacity	Slow progress; single point of failure.	Strict prioritisation (three MUSTs), workflow automation, community visibility that brings interest inbound.

Support & funding needs (summary)

- **Legal costs (small, concrete):** professional review of privacy/terms before charging, roughly DKK 6,000–10,000; deferred-payment terms under discussion.
- **Living runway (the real constraint):** the product needs no capital — it is built. Scarce resource: founder time. A few months of focused full-time push is the highest-impact support.
- **Go-to-market guidance:** engineering is the strength; experienced advice on direct B2B sales to Danish/Nordic software teams would raise the odds most.
- **Network access:** warm introductions to 10–50-person, AI-heavy software teams — one good introduction beats any ad budget.
- **Deliberately NOT asking for:** product-development funding (built), infrastructure (near-zero cost), or hiring (premature).

All statements verified against the FixProve project record (product status, registry publications, company registration, tax filings, legal outreach) as of 26 August 2026. Prepared for the AID Business Incubator: Funding Pathway, Module 1.
